

# PACIFICORP DEMAND-SIDE RESOURCE POTENTIAL ASSESSMENT FOR 2019-2038

Volume 4: Class 2 DSM Analysis Appendices A through H

June 30, 2019

Report prepared for:  
PACIFICORP

Energy Solutions. Delivered.

This work was performed by

Applied Energy Group, Inc. (AEG)  
500 Ygnacio Valley Rd, Suite 250  
Walnut Creek, CA 94596

Project Director: I. Rohmund

Project Manager: K. Kolnowski

Project Team: K. Marrin      D. Burdjalov  
K. Walter      C. Arzbaecher  
F. Nguyen  
B. Bushong

# CONTENTS

<b>A</b>	<b>MARKET CHARACTERIZATION AND ENERGY MARKET PROFILES</b> .....	<b>A-1</b>
	Base-Year Energy Use Summary .....	A-1
	Market Profile Framework .....	A-1
	Residential Sector .....	A-2
	Commercial Sector .....	A-3
	Industrial Sector .....	A-4
	Irrigation Sector .....	A-5
	Street Lighting Sector .....	A-5
	Detailed Market Profiles by Sector, State, and Segment .....	A-6
	Residential Market Profiles .....	A-7
	Commercial Market Profiles .....	A-37
	Industrial Market Profiles .....	A-176
	Irrigation Market Profiles .....	A-326
	Street Lighting Market Profiles .....	A-329
<b>B</b>	<b>BASELINE PROJECTIONS</b> .....	<b>B-1</b>
	Baseline Projections by State and Sector .....	B-1
	Baseline Projections by State, Sector, and Segment .....	B-4
	Baseline Projection Pie Charts by State, Sector, and Segment .....	B-19
	Baseline Projections Pie Charts by State, Sector, and End Use .....	B-32
<b>C</b>	<b>TECHNICAL ACHIEVABLE POTENTIAL PIE CHARTS</b> .....	<b>C-1</b>
<b>D</b>	<b>LIST OF CLASS 2 EMERGING TECHNOLOGY MEASURES</b> .....	<b>D-1</b>
<b>E</b>	<b>CLASS 2 DSM RESOURCE RAMPING</b> .....	<b>E-1</b>
	General Methodology .....	E-1
	Specific Ramp Rate Methodology .....	E-2
<b>F</b>	<b>COMPARISON OF WASHINGTON MEASURES TO THE COUNCIL'S 7TH PLAN AND THE RTF</b> ..	<b>F-1</b>
	Residential Sector .....	F-1
	Commercial Sector .....	F-1
	Industrial, Irrigation, and Street Lighting Sectors .....	F-2
<b>G</b>	<b>STATE-LEVEL ADMINISTRATIVE COST ANALYSIS AND FINDINGS</b> .....	<b>G-1</b>
	Summary of Results .....	G-1
	Approach .....	G-2
	Analysis of PacifiCorp Data .....	G-3
	Benchmarking Analysis .....	G-4
	Final Results and Comparisons .....	G-4
<b>H</b>	<b>WASTE-HEAT-TO-POWER AND REGENERATIVE TECHNOLOGY ANALYSIS AND FINDINGS</b> ...	<b>H-1</b>
	Overview .....	H-1
	Waste Heat to Power Technology Updates: .....	H-1
	Elevator Regeneration Technology Updates .....	H-2
	Conveyor Regeneration Technology Updates .....	H-3
	Results of Analysis .....	H-4

# LIST OF FIGURES

Figure B-1 Overall Baseline Projection by Sector (MWh) ..... B-1

Figure B-2 California Baseline Projection by Sector (MWh) ..... B-2

Figure B-3 Idaho Baseline Projection by Sector (MWh) ..... B-2

Figure B-4 Utah Baseline Projection by Sector (MWh) ..... B-3

Figure B-5 Washington Baseline Projection by Sector (MWh) ..... B-3

Figure B-6 Wyoming Baseline Projection by Sector (MWh) ..... B-4

Figure B-7 Overall Residential Baseline Projection by Segment (MWh) ..... B-4

Figure B-8 California Residential Baseline Projection by Segment (MWh) ..... B-5

Figure B-9 Idaho Residential Baseline Projection by Segment (MWh) ..... B-5

Figure B-10 Utah Residential Baseline Projection by Segment (MWh) ..... B-6

Figure B-11 Washington Residential Baseline Projection by Segment (MWh) ..... B-6

Figure B-12 Wyoming Residential Baseline Projection by Segment (MWh) ..... B-7

Figure B-13 Overall Commercial Baseline Projection by Segment (MWh) ..... B-7

Figure B-14 California Commercial Baseline Projection by Segment (MWh) ..... B-8

Figure B-15 Idaho Commercial Baseline Projection by Segment (MWh) ..... B-8

Figure B-16 Utah Commercial Baseline Projection by Segment (MWh) ..... B-9

Figure B-17 Washington Commercial Baseline Projection by Segment (MWh) ..... B-9

Figure B-18 Wyoming Commercial Baseline Projection by Segment (MWh) ..... B-10

Figure B-19 Overall Industrial Baseline Projection by Segment (MWh) ..... B-10

Figure B-20 California Industrial Baseline Projection by Segment (MWh) ..... B-11

Figure B-21 Idaho Industrial Baseline Projection by Segment (MWh) ..... B-11

Figure B-22 Utah Industrial Baseline Projection by Segment (MWh) ..... B-12

Figure B-23 Washington Industrial Baseline Projection by Segment (MWh) ..... B-12

Figure B-24 Wyoming Industrial Baseline Projection by Segment (MWh) ..... B-13

Figure B-25 Overall Irrigation Baseline Projection by Segment (MWh) ..... B-13

Figure B-26 California Irrigation Baseline Projection by Segment (MWh) ..... B-14

Figure B-27 Idaho Irrigation Baseline Projection by Segment (MWh) ..... B-14

Figure B-28 Utah Irrigation Baseline Projection by Segment (MWh) ..... B-15

Figure B-29 Washington Irrigation Baseline Projection by Segment (MWh) ..... B-15

Figure B-30 Wyoming Irrigation Baseline Projection by Segment (MWh) ..... B-16

Figure B-31 Overall Street Lighting Baseline Projection by Segment (MWh) ..... B-16

Figure B-32 California Street Lighting Baseline Projection by Segment (MWh) ..... B-17

Figure B-33 Idaho Street Lighting Baseline Projection by Segment (MWh) ..... B-17

Figure B-34 Utah Street Lighting Baseline Projection by Segment (MWh) ..... B-18

Figure B-35 Washington Street Lighting Baseline Projection by Segment (MWh) ..... B-18

Figure B-36 Wyoming Street Lighting Baseline Projection by Segment (MWh) ..... B-19

Figure B-37 California Residential Baseline Projection by Segment, 2038 ..... B-19

Figure B-38 Idaho Residential Baseline Projection by Segment, 2038 ..... B-20

Figure B-39 Utah Residential Baseline Projection by Segment, 2038 ..... B-20

Figure B-40 Washington Residential Baseline Projection by Segment, 2038 ..... B-21

Figure B-41 Wyoming Residential Baseline Projection by Segment, 2038 ..... B-21

Figure B-42 California Commercial Baseline Projection by Segment, 2038 ..... B-22

## MARKET CHARACTERIZATION AND ENERGY MARKET PROFILES

In this section, we describe how customers in the PacifiCorp service territory use electricity in the base year of the study, 2016. It begins with a high-level summary of energy use by state and sector and then provides more detail on each sector.

### Base-Year Energy Use Summary

Total electricity use for the residential, commercial, industrial, irrigation, and street lighting sectors for PacifiCorp in 2016, excluding sales to special contract customers from the industrial sectors, is 37,526 GWh. A tabular breakdown of consumption among state territories and sectors is given below in Table A-1. This comprises the energy use control totals to which all modeling activities are calibrated in the base year. PacifiCorp's Oregon service territory is not considered in this study, as the statewide energy efficiency planning is conducted by the Energy Trust of Oregon.

Table A-1 PacifiCorp State and Sector Control Totals in Base Year 2016 (MWh)

State	Residential	Commercial	Industrial	Irrigation	Street Lighting	Total
California	371,032	240,455	52,383	89,866	1,894	755,630
Washington	1,593,977	1,508,371	767,694	159,431	10,217	4,039,689
Idaho	691,028	480,261	296,420	673,789	2,691	2,144,189
Utah	6,705,077	8,677,403	5,706,313	232,446	76,391	21,397,631
Wyoming	1,020,668	1,393,220	6,736,944	26,516	11,954	9,189,301
Total	10,381,781	12,299,709	13,559,755	1,182,048	103,147	37,526,440

### Market Profile Framework

As described in the Analysis Approach in Volume 2, Chapter 2, the market for each state, sector, and market segment is characterized by a market profile that allocates energy consumption to the available end-use and technology categories. These market profiles are calibrated to PacifiCorp equipment saturation surveys, technology and measure databases, and finally to the energy control totals listed above. A list of the end uses and technologies for each sector is provided below, and each detailed market profile is available in the section that follows.

## Residential Sector

A list of the end uses and technologies assessed in the residential sector is given in Table A-2. The unique market profile for each market segment in each state is available in the section that follows.

Table A-2 *End Uses and Technologies in Market Profile for the Residential Sector*

End Use	Technology
Cooling	Central AC
Cooling	Room AC
Cooling	Air-Source Heat Pump
Cooling	Geothermal Heat Pump
Cooling	Evaporative AC
Space Heating	Electric Room Heat
Space Heating	Electric Furnace
Space Heating	Air-Source Heat Pump
Space Heating	Geothermal Heat Pump
Space Heating	Secondary Heating
Water Heating	Water Heater (<= 55 Gal)
Water Heating	Water Heater (> 55 Gal)
Interior Lighting	General Service Screw-in
Interior Lighting	Linear Lighting
Interior Lighting	Exempted Lighting
Exterior Lighting	Screw-in
Appliances	Clothes Washer
Appliances	Clothes Dryer
Appliances	Dishwasher
Appliances	Refrigerator
Appliances	Freezer
Appliances	Second Refrigerator
Appliances	Stove/Oven
Appliances	Microwave
Electronics	Personal Computers
Electronics	Monitor
Electronics	Laptops
Electronics	TVs
Electronics	Printer/Fax/Copier
Electronics	Set-top Boxes/DVRs
Electronics	Devices and Gadgets
Miscellaneous	Electric Vehicles
Miscellaneous	Pool Pump
Miscellaneous	Pool Heater
Miscellaneous	Hot Tub/Spa
Miscellaneous	Furnace Fan
Miscellaneous	Well pump
Miscellaneous	Miscellaneous

## Commercial Sector

A list of the end uses and technologies for the commercial sector analysis is given in Table A-3. The unique market profile for each market segment in each state is available in the section that follows.

Table A-3 *End Uses and Technologies in Market Profile for the Commercial Sector*

End Use	Technology
Cooling	Air-Cooled Chiller
Cooling	Water-Cooled Chiller
Cooling	RTU
Cooling	PTAC
Cooling	PTHP
Cooling	Evaporative Central AC
Cooling	Air-Source Heat Pump
Cooling	Geothermal Heat Pump
Heating	Electric Furnace
Heating	Electric Room Heat
Heating	PTHP
Heating	Air-Source Heat Pump
Heating	Geothermal Heat Pump
Ventilation	Ventilation
Water Heating	Water Heater
Interior Lighting	General Service Lighting
Interior Lighting	Exempted Lighting
Interior Lighting	Linear Lighting
Interior Lighting	High-Bay Lighting
Exterior Lighting	General Service Lighting
Exterior Lighting	Linear Lighting
Exterior Lighting	Area Lighting
Refrigeration	Walk-in Refrigerator/Freezer
Refrigeration	Reach-in Refrigerator/Freezer
Refrigeration	Glass Door Display
Refrigeration	Open Display Case
Refrigeration	Icemaker
Refrigeration	Vending Machine
Food Preparation	Oven
Food Preparation	Fryer
Food Preparation	Dishwasher
Food Preparation	Hot Food Container
Food Preparation	Steamer
Office Equipment	Desktop Computer
Office Equipment	Laptop
Office Equipment	Monitor
Office Equipment	Server
Office Equipment	Printer/Copier/Fax
Office Equipment	POS Terminal
Miscellaneous	Non-HVAC Motors
Miscellaneous	Pool Pump
Miscellaneous	Pool Heater
Miscellaneous	Clothes Washer
Miscellaneous	Clothes Dryer
Miscellaneous	Miscellaneous

## Industrial Sector

A list of the end uses and technologies for the industrial sector analysis is given in Table A-4. The unique market profile for each market segment in each state is available in the section that follows.

Table A-4 *End Uses and Technologies in Market Profile for the Industrial Sector*

End Use	Technology
Cooling	Water-Cooled Chiller
Cooling	RTU
Cooling	Air-Source Heat Pump
Cooling	Geothermal Heat Pump
Heating	Electric Furnace
Heating	Electric Room Heat
Heating	Air-Source Heat Pump
Heating	Geothermal Heat Pump
Ventilation	Ventilation
Interior Lighting	Screw-in
Interior Lighting	High-Bay Fixtures
Interior Lighting	Linear Lighting
Exterior Lighting	Screw-in
Exterior Lighting	Area Lighting
Exterior Lighting	Linear Lighting
Motors	Pumps
Motors	Fans & Blowers
Motors	Compressed Air
Motors	Material Handling
Motors	Other Motors
Process	Process Heating
Process	Process Cooling
Process	Process Refrigeration
Process	Process Electrochemical
Process	Process Other
Miscellaneous	Miscellaneous

## Irrigation Sector

A list of the end uses and technologies for the irrigation sector analysis is given in Table A-5. The unique market profile for each market segment in each state is available in the section that follows.

Table A-5 *End Uses and Technologies in Market Profile for the Irrigation Sector*

End Use	Technology
Motors	Pumps (< 100 HP)
Motors	Pumps (100 HP+)
Motors	Other Motors

## Street Lighting Sector

A list of the end uses and technologies for the industrial sector analysis is given in Table A-6. The unique market profile for each market segment in each state is available in the section that follows.

Table A-6 *End Uses and Technologies in Market Profile for the Street Lighting Sector*

End Use	Technology
Street Lighting	100 Watt Fixture
Street Lighting	150 Watt Fixture
Street Lighting	250 Watt Fixture
Street Lighting	400 Watt Fixture
Street Lighting	1000 Watt Fixture

## Detailed Market Profiles by Sector, State, and Segment

Market profiles describe estimated electricity use by sector, segment, end use and technology in the base year of the study (2016). A market profile includes the following elements:

- Market size is a representation of the number of customers in the segment. For the residential sector, it is number of households. In the commercial sector, it is floor space measured in square feet. For the industrial sector, it is number of employees. For irrigation, it is number of service points. For street lighting, it is number of fixtures.
- Saturations define the fraction of buildings with the various technologies. (e.g., homes with electric space heating)
- UEC (unit energy consumption) or EUI (energy-use index) describes the average energy consumed in 2016 by a specific technology in buildings that have the technology. UECs are expressed in kWh/household for the residential sector, and EUIs are expressed in kWh/square foot or kWh/employee for the commercial and industrial sectors, respectively.
- Intensity for the residential sector represents the average energy use for the technology across all homes in 2016 and is computed as the product of the saturation and the UEC. For the commercial and industrial sectors, intensity, computed as the product of the saturation and the EUI, represents the average use for the technology per square foot or per employees in 2016.
- Usage is the estimated 2016 energy use by a technology/end use in the segment. It is the product of the market size and intensity and is quantified in MWh for electricity.

The tables below present the following market profiles for each state:

- Residential market profiles
- Commercial market profiles
- Industrial market profiles
- Irrigation market profiles
- Street Lighting market profiles

These market profiles are given in the base year for average, existing customers as well as new construction customers that will be built in years beyond the base year. This means there is not yet any usage or consumption associated with new construction market profiles shown below. Please note that this information is provided at the meter level in order for UEC and consumption values to be more easily comparable. To assess measure potential, data was converted to usage at the generator using the line loss factors in Table 3-7 of Volume 2 of this report.

## Residential Market Profiles

Table A-7 California Single Family Existing Market Profile

End Use	Technology	Saturation	UEC (kWh)	Intensity (kWh/HH)	Usage (MWh)
Cooling	Central AC	8.4%	1,636	137	3,495

## Commercial Market Profiles

The average size of the prototypical commercial building is assumed to be the same across all states, as shown in the table below.

Table A-37 Commercial Building Assumed Average Square Feet by Segment

Segments	Average Square Feet (all states)
Large Office	50,000
Small Office	10,000
Large Retail	100,000
Small Retail	15,000
Restaurant	5,500
Grocery	20,000
Health	30,000
College	30,000
School	30,000
Lodging	55,000
Warehouse	100,000
Warehouse, Controlled Atm.	100,000
Data Center	50,000
Miscellaneous	100,000

## BASELINE PROJECTIONS

As mentioned in the analysis approach section of Volume 2 of this report, prior to developing estimates of energy-efficiency potential, AEG developed baseline projections of annual electricity use for 2016 through 2038 by state, sector, customer segment and end use without new utility DSM programs. These baseline projections are provided below.

### Baseline Projections by State and Sector

Figure B-1 Overall Baseline Projection by Sector (MWh)

Figure B-70 Washington Commercial Baseline Projection by End Use, 2038

Total: 1,853,792 MWh

Figure B-71 Wyoming Commercial Baseline Projection by End Use, 2038

Total: 1,664,722 MWh

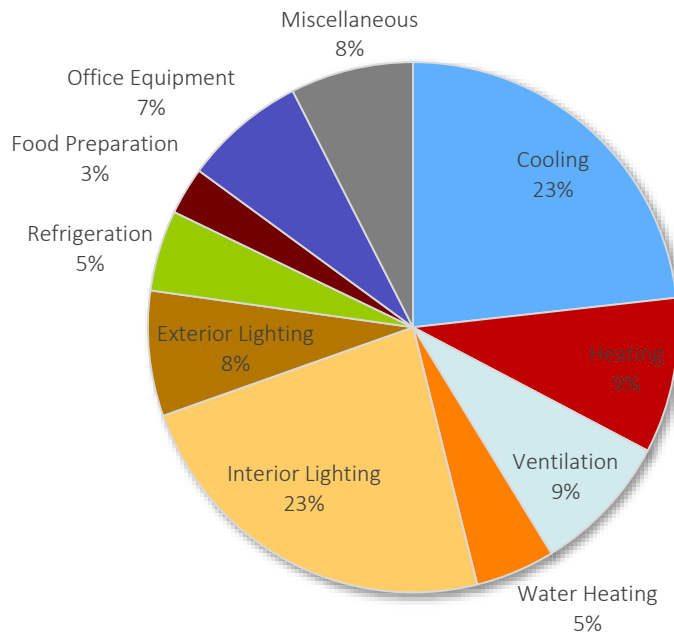

Figure B-72 California Industrial Baseline Projection by End Use, 2038

Total: 80,145 MWh

Figure B-73 Idaho Industrial Baseline Projection by End Use, 2038

Total: 314,849 MWh

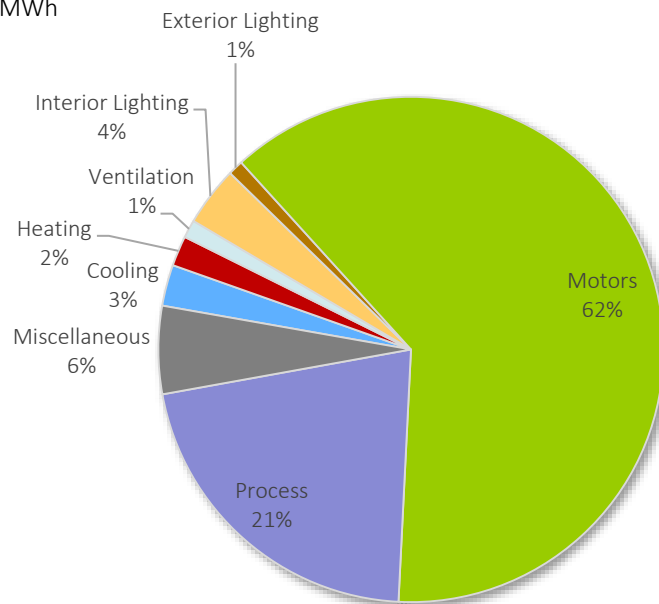

Figure B-74 Utah Industrial Baseline Projection by End Use, 2038

Total: 7,614,576 MWh

Figure B-75 Washington Industrial Baseline Projection by End Use, 2038

Total: 1,168,972 MWh

Figure B-76 Wyoming Industrial Baseline Projection by End Use, 2038

Total: 8,163,836 MWh

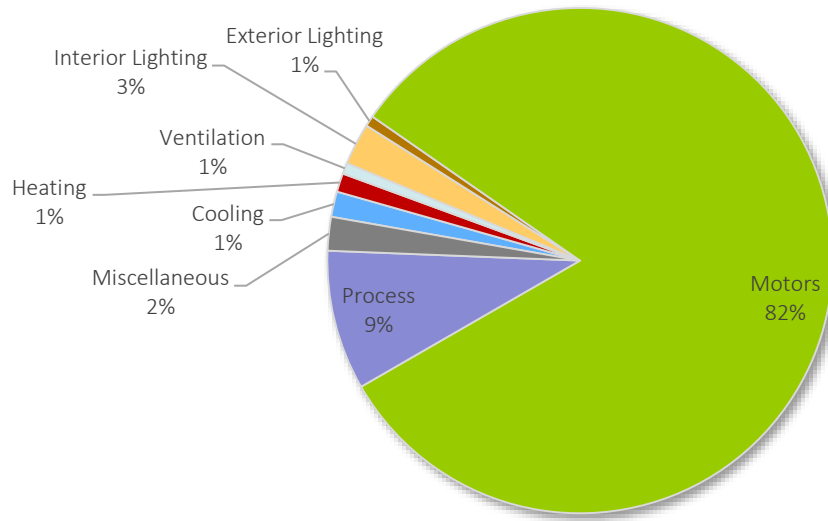

Figure B-77 California Irrigation Baseline Projection by End Use, 2038

Total: 102,649 MWh

Figure B-78 Idaho Irrigation Baseline Projection by End Use, 2038

Total: 735,021 MWh

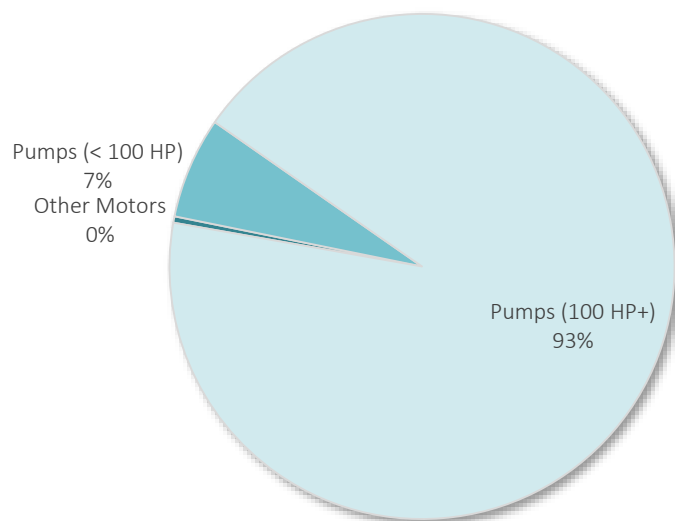

Figure B-79 Utah Irrigation Baseline Projection by End Use, 2038

Total: 234,365 MWh

Figure B-80 Washington Irrigation Baseline Projection by End Use, 2038

Total: 172,922 MWh

Figure B-81 Wyoming Irrigation Baseline Projection by End Use, 2038

Total: 25,697 MWh

Street Lighting consists of a single end use and is not shown here.

## TECHNICAL ACHIEVABLE POTENTIAL PIE CHARTS

This section provides pie charts that show the Technical Achievable Potential for each state territory and sector in the study, broken down by end use in 2038.

Figure C-1 California Residential Technical Achievable Potential by End Use, 2038

Total: 126,785 MWh

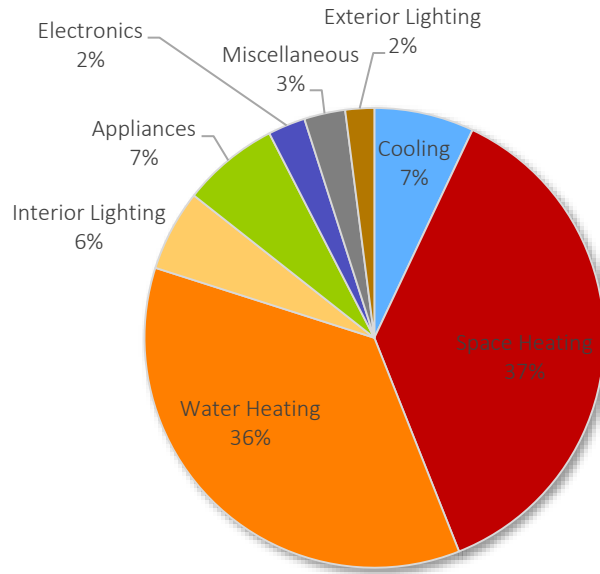

Figure C-2 Idaho Residential Technical Achievable Potential by End Use, 2038

Total: 206,534 MWh

Figure C-3 Utah Residential Technical Achievable Potential by End Use, 2038

Total: 1,660,103 MWh

Figure C-4 Washington Residential Technical Achievable Potential by End Use, 2038

Total: 455,686 MWh

Figure C-5 Wyoming Residential Technical Achievable Potential by End Use, 2038

Total: 225,090 MWh

Figure C-6 California Commercial Technical Achievable Potential by End Use, 2038

Total: 63,347 MWh

Figure C-7 Idaho Commercial Technical Achievable Potential by End Use, 2038

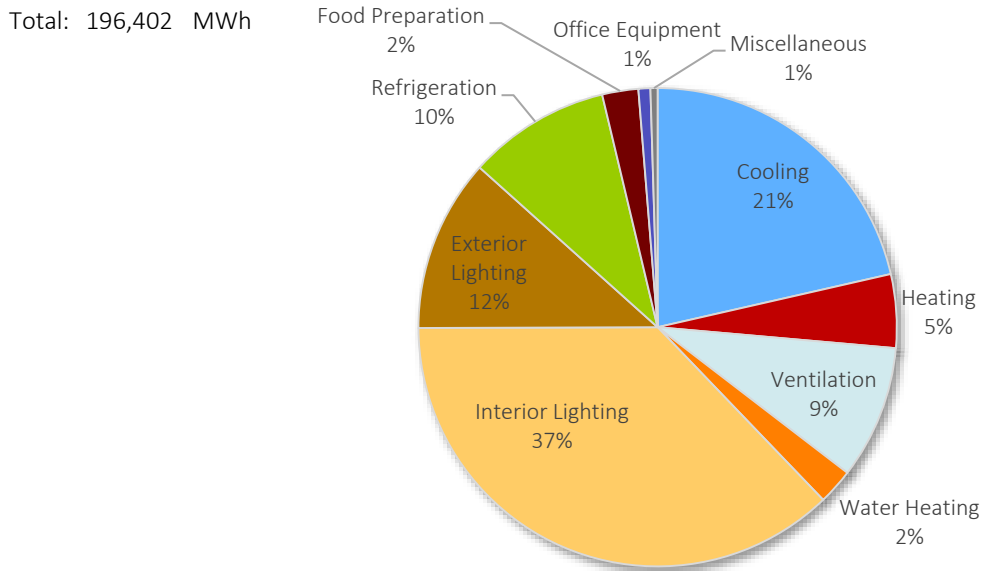

Figure C-8 Utah Commercial Technical Achievable Potential by End Use, 2038

Figure C-9 Washington Commercial Technical Achievable Potential by End Use, 2038

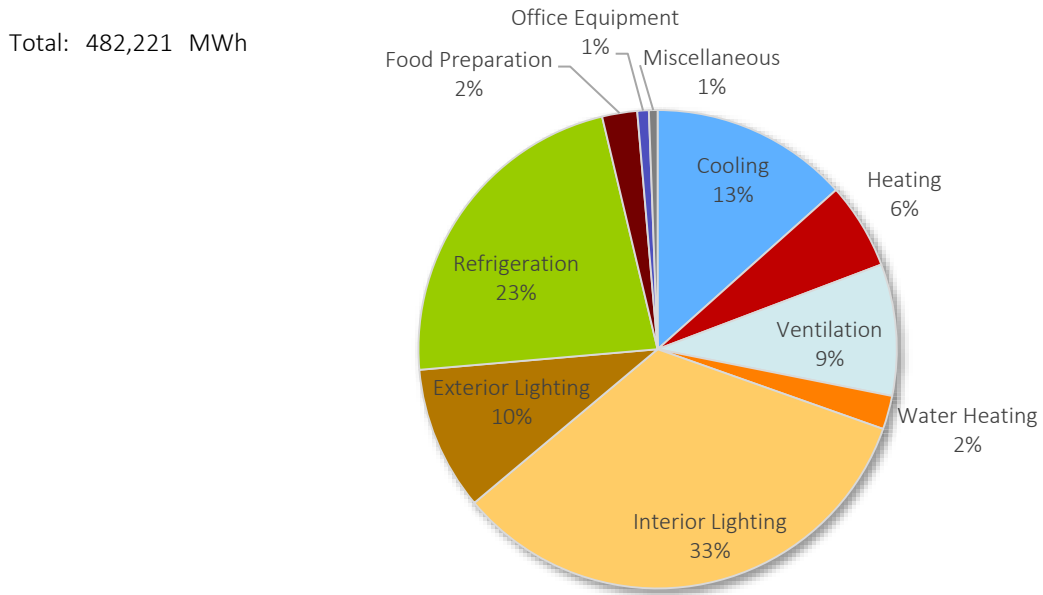

Figure C-10 Wyoming Commercial Technical Achievable Potential by End Use, 2038

Figure C-11 California Industrial Technical Achievable Potential by End Use, 2038

Total: 10,127 MWh

Figure C-12 Idaho Industrial Technical Achievable Potential by End Use, 2038

Total: 43,536 MWh

Figure C-13 Utah Industrial Technical Achievable Potential by End Use, 2038

Total: 1,039,868 MWh

Figure C-14 Washington Industrial Technical Achievable Potential by End Use, 2038

Total: 150,422 MWh

Figure C-15 Wyoming Industrial Technical Achievable Potential by End Use, 2038

Figure C-16 California Irrigation Technical Achievable Potential by End Use, 2038

Total: 10,464 MWh

Figure C-17 Idaho Irrigation Technical Achievable Potential by End Use, 2038

Total: 69,311 MWh

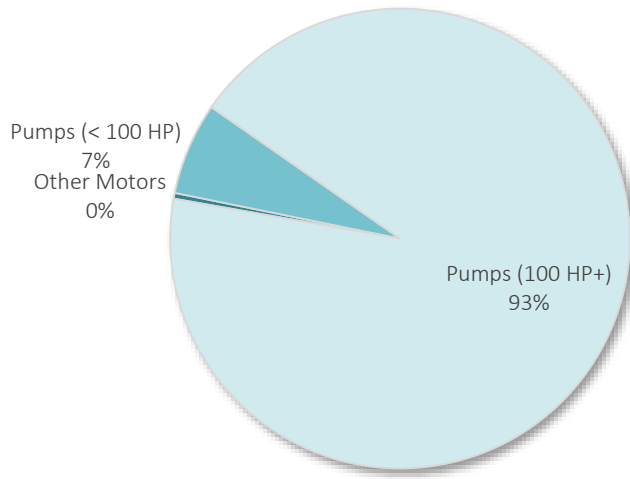

Figure C-18 Utah Irrigation Technical Achievable Potential by End Use, 2038

Total: 22,893 MWh

Figure C-19 Washington Irrigation Technical Achievable Potential by End Use, 2038

Total: 17,561 MWh

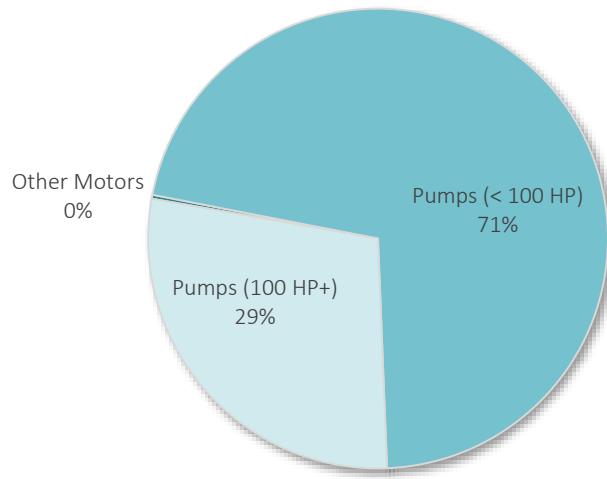

Figure C-20 Wyoming Irrigation Technical Achievable Potential by End Use, 2038

Total: 2,546 MWh

Street Lighting consists of a single end use and is not shown here.

## LIST OF CLASS 2 EMERGING TECHNOLOGY MEASURES

As described in Chapter 3 of Volume 2 of this report, AEG developed the Class 2 DSM measure list based on a comprehensive review of measures implemented in current industry best practice programs and exhaustive research into the pipeline of technologies that may become viable over the study time horizon. The emerging technologies selected for inclusion in the study (shown in Table D-1) are measures that have not yet gained mainstream adoption but can reasonably be expected to reach commercial availability within the study time horizon.

Table D-341 Emerging Technology Measures Included in Class 2 DSM Analysis

Sector	Measure Name
Residential	Advanced Power Strips - IR Sensing
Residential	Advanced Power Strips - Load or Occupancy
Residential	Connected Home Control System
Residential	Ducting - Repair and Sealing - Aerosol
Residential	Ductless Mini Split Heat Pump (Ducted Forced Air)
Residential	Windows - Cellular Shades
Residential	ENERGY STAR Home Design
Residential	Space Heating - Heat Recovery Ventilator
Residential	Thermostat - Connected
Residential	Water Heater - Desuperheater
Residential	Water Heater - Drainwater Heat Recovery
Residential	Water Heater - Solar System
Residential	Water Heater - Thermostatic Shower Restriction Valve
Residential	Windows - Low-e Storm Addition
Residential	Advanced New Construction Design - Zero Net Energy
Residential	Integrated Heat Pump - Combination HVAC and DHW
Residential	Insulation - Insulated Concrete Forms
Residential	Pool Cleaner - Robotic
Residential	Building Shell - Liquid-Applied Weather-Resistive Barrier
Residential	Insulation - Wall Sheathing - External - Insulated Vinyl Siding
C&I	Commercial Laundry - Ozone Treatment

Sector	Measure Name
C&I	Compressed Air - End Use Optimization
C&I	Dairy - Heat Recovery from Refrigeration
C&I	Data Center - Cutting Edge Measures
C&I	Ductless Mini Split Heat Pump
C&I	HVAC - Dedicated Outdoor Air System (DOAS)
C&I	Interior Lighting - Embedded Fixture Controls
C&I	Interior Lighting - Networked Fixture Controls
C&I	Interior Lighting - LEC Exit Lighting
C&I	Miscellaneous - Improved Vertical Lift Technology
C&I	Refrigeration - Permanent Magnet Synchronous Fan Motor
C&I	RTU - Advanced Controls
C&I	Strategic Energy Management
C&I	Streetlighting - Dimming and Tuning Controls
C&I	Thermostat - Wi-Fi/Interactive
C&I	Ultra-Low Temperature Freezer - ENERGY STAR
C&I	Ventilation - Nighttime Air Purge
C&I	Ventilation - Fan Drive Improvements
C&I	Ventilation - Permanent Magnet Synchronous Fan Motor
C&I	Interior Lighting - Photoluminescent Exit Lighting
C&I	Refrigeration - Evaporative Condenser
C&I	Center Pivot - Low Energy Spray Application
C&I	Chiller - Variable Speed Compressor
C&I	Interior Lighting - Networked Fixture Controls
C&I	Compressed Air - Heat of Compression Desiccant Dryer
C&I	Petroleum Pump - Energy Management

Certain technologies reviewed were still in the laboratory stage without reliable estimates of cost or operating characteristics at the time of the analysis and were thus excluded from the estimation of Class 2 DSM potential in this assessment. In addition, the savings that would be attributed to some of these measures, specifically efficient lighting, are already captured through other technologies included in the assessment, and therefore, including these emerging technologies would not have had a material, net impact on the identified potential. Table D-2 provides a list of measures falling into this category, along with a brief explanation on why each was excluded from the analysis.

Table D-342 Emerging Technology Measures Excluded from Class 2 DSM Analysis

Sector	Measure Name	Rationale for Exclusion
Residential	Ceiling Fan - Occupancy Sensor	AEG does not expect this measure to gain much traction or provide significant savings compared to residential lighting controls due to the fan's low energy use. Fan shutoff could also result in a cooling penalty if the central system must turn on mid-day because the fan stops.
Residential	Central AC - Non-Vapor Compression - Magnetocaloric	Screened out - will be reflected in high efficiency AC if they come on market, but technology is only at prototypical level.
Residential	Central AC - Waste Heat Recovery	Screened out - this measure is not being used in residential applications and would require custom knowledge of specific building loads both for the heat source (compressor superheat) and heat sink (not space heating). We do, however, model heat recovery during the winter when the heat source and sink are one in the same.
Residential	Central AC - Water-Cooled Condenser	Screened out - concept has been validated for hot/dry climates, but likely not effective strategy in PNW. Technology more applicable to larger system size (i.e. C&I chillers); smaller systems waste a lot of water and are not maintained properly. Evaporative AC and hybrid systems with evaporative pre-cooling more prevalent. This measure is not recommended for residential applications, however water-cooled chillers are common in C&I settings and are captured within our standard measure list. There are also significant health risks associated with this application in a residential setting.
Residential	Central Heat Pump - Advanced Defrost Method	Screened out - this feature is assumed to be included in advanced (highly efficient) air-source heat pumps as part of the equipment measures and should not be added as a separate measure.
Residential	Clothes Dryer - Heat Recovery	Screened out - this measure is not currently available residentially and would require custom knowledge of specific building loads to characterize the heat sink.
Residential	Clothes Washer - Polymer Bead Washer	Screened out - Available from a few vendors but have not gained market traction. Major impact = water savings. Revisit in a couple years.
Residential	Ductless Mini Split AC	Screened out: this measure is more appropriate in southern California, where heating loads are minimal. In climates with nontrivial heating loads, this measure would neglect heating benefits realized through installation of a ductless minisplit heat pump. Additionally, central cooling is much more prevalent than zonal cooling across all segments in Utah, which reduces applicability.

Sector	Measure Name	Rationale for Exclusion
Residential	Electronics - Advanced Outlets	Screened out - possible to include, but too much overlap with advanced power strips. E3T even references these as having an advanced power strip incentive from BPA.
Residential	Exterior Lighting - Networked Fixture Controls	Screened out as expensive in residential context and having too much overlap with (1) scheduling/timers, (2) occupancy/vacancy sensing, (3) dimming (or task tuning), and (4) daylighting--and communication between fixtures/lamps. This is already included within the connected home measure. Since this needs to connect to a larger "EMS"-type system, it is not suitable to bundle with individual lamp replacements.
Residential	HVAC - District Heating and Cooling	Promising; has mostly been applied to commercial campuses to date. Could be applicable for smaller residential communities (gated community, low-rise multifamily complex, cul-de-sac). Interesting application for an "Eco-Block", community, or rural microgrid; other flavors include residential geothermal loop leasing, etc. Screened out due to characterization difficulty and likelihood of custom project, but pilots should be encouraged.
Residential	HVAC - Electronically Commutated Motors	Screened out - effectively required by residential furnace fans starting 2019. Could be offered as drop-in replacement for existing split capacitor motors, but low operating hours/high programming costs/multi-speed baseline in residential applications would lead to low cost-effectiveness. Could add in COM sector.
Residential	HVAC - Natural Ventilation / Mixed-Mode Conditioning	Screened out - this is a commercial measure. Natural ventilation in residential sector is highly behavioral and already prevalent.
Residential	Insulation - Phase Change Building Materials	Screened out as low emerging technology with low likelihood of gaining market traction. Not commercially available at the moment.
Residential	Insulation - Aerogel	Screened out - no savings data available, and difficult to get trustworthy costs; recommend revisiting this high efficiency insulation level later. Some target costs are available, but this advanced insulation material is not prevalent at this time.
Residential	Insulation - Wall Cavity - Thermal Break Shear	Possible to add based on rough estimates from 2017 NEEA case study, though separating the wall insulation impacts from total home impacts (that include efficient windows) could prove challenging. This type of measure is likely to be included when designing a Zero Net Energy (ZNE) home. That measure also includes windows and other efficient shell measures.

Sector	Measure Name	Rationale for Exclusion
Residential	Interior Lighting - Heliostat Daylighting	Screened out as low emerging technology with low likelihood of gaining market traction. More applicable to commercial sector, and only cost is available.
Residential	Interior Lighting - Networked Fixture Controls	Screened out as expensive in residential context and having too much overlap with (1) scheduling/timers, (2) occupancy/vacancy sensing, (3) dimming (or task tuning), and (4) daylighting--and communication between fixtures/lamps. Included in connected home control measure as well. Since this needs to connect to a larger "EMS"-type system, it is not suitable to bundle with individual lamp replacements.
Residential	Non-Intrusive Load Monitoring	Screened out - this technology provides load disaggregation based on a single metering point as opposed to submetering each individual end use. This is considered an enabling technology and does not actually save energy unless coupled with other measures and programs.
Residential	Photovoltaics - Direct DC Distribution	Screened out - not mature enough but promising. Best applied to zero net energy new construction.
Residential	Radiant Cooling - Chilled Beam/Ceiling Panels	Promising technology to investigate further; unlikely to get robust prescriptive measure characterization.
Residential	Refrigeration - Non-Vapor Compression - Magnetocaloric	Screened out - will be reflected in high efficiency refrigerators if they come on market, but technology is only at prototypical level.
Residential	Solar Pre-heater for Ventilation Air	Screened out as low emerging technology with low likelihood of gaining market traction, especially in residential sector
Residential	Stove/Oven - Induction	Consider adding; data available but unclear how it overlaps with the 7th Plan Efficient Oven measure. Induction oven is more parallel to the 7th plan efficient level for a convection stove/oven rather than a separate, higher efficiency level.
Residential	Ventilation - Permanent Magnet Synchronous Fan Motor	Should be added to commercial; not applicable to residential
Residential	Water Heater - Advanced Storage Tanks	Screened out - still in R&D, only target cost and savings levels available.
Residential	Water Heater - Connected Controls	Screened out - intelligent controls are included in connected home measure and likely to be included in load management/DLC program analysis. This is a new device. The controls come pre-installed with the unit. This option is also already included within our "DLC Water Heating" measure within the Class 1 analysis.

Sector	Measure Name	Rationale for Exclusion
Residential	Water Heater - Solar Electric	If solar PV is already installed, some of that energy will be used for water heating. Upon further review, this measure is not suitable since it connects directly with the water heater and is not used for net-energy metering. Will exclude this measure.
Residential	Windows - Aerogel Insulation	Screened out. This measure for super high-performance windows is possible, but the high cost (estimated by E3TNW to be 6x the cost of a conventional double-pane window) makes the technology unlikely to be cost effective.
Residential	Windows - Automated Shading	Screened out - No cost data available; has to be paired with dimming lighting controls and is an enabling technology for automated dynamic daylighting systems.
C&I	HVAC - Advanced Non-Vapor Compression Systems	While this a large set of important emerging technologies, it is unclear which one will win out; so far only evaporative AC (already a separate measure) and absorption/adsorption heat pumps are commercially available. Other technologies like magnetocaloric, ejector heat pump, and vuilleumier heat pump are in more advanced emerging stage. Most promising with greatest potential (yet still in R&D) is thermoelastic. These technologies are still unproven, with limited to no savings or cost data available. As these technologies come into the market and if they become competitive, the efficiencies will be reflected in HVAC efficiency levels. However, AEG encourages Pacificorp to fund pilot projects and get better data on these systems.
C&I	Central Heat Pump - CO2 Compression	This technology is likely expensive due to high pressure requirements and has not been widely implemented in the United States to date, though it has seen implementation in Europe. This is a promising heat pump application and is an appealing way to supplant high GWP refrigerants. AEG recommends investigating transcritical CO2 systems in a C&I refrigeration setting in future years, though HVAC applications are also available.
C&I	Chiller - Evaporative - Sub-Wet Bulb	Given recent demonstrations by PG&E (2017) and SCE (2015), various entities see this as a promising technology. However, it will be difficult to characterize and get reliable data for savings in various locations as well as cost. Could be applicable to UT.
C&I	Circulating Engine Block Heater	Enough data to include from reputable sources (2014/15 SCE/CalTF workpapers). This measure is different from the Engine Block Heater Controls measure that is already in the study.

Sector	Measure Name	Rationale for Exclusion
C&I	Commercial Laundry - Clothes Dryer - Heat Recovery	Limited development for laundromat/larger commercial applications, but nevertheless promising application. Likely more applicable to gas dryers, and not enough data to include at the moment.
C&I	Commercial Laundry - CO2 Cleaning	Promising technology that has been implemented but is an expensive alternative to traditional PCE process. Could include as measure with rough costs and savings estimates.
C&I	Commercial Laundry - Wastewater Recycling	Difficult to characterize and get reliable data for custom process like this, but this measure provides significant energy savings as well as water and wastewater non-energy benefits. Similar to dryer heat recovery, this is likely to be more applicable to gas water heating.
C&I	Electric Arc Furnace - Waste Heat Recovery	New Arc Furnaces are a measure from 7th Plan and in the measure list, so their saturation will have to be quantified and waste heat recovery for these units could be included as an emerging industrial measure. No cost data available; will likely have to use DEER air-to-air heat exchanger cost. However, the waste heat from these systems can be high quality and could be used to generate electricity in a Waste Heat to Power application that will be looked at during AEG's WTP&RT analysis. Therefore, the waste heat recovery measure (often used for low-grade heat) may be supplanted.
C&I	Electronics - Advanced Outlets	Screened out - possible to include, but too much overlap with advanced power strips. E3T even references these as having an advanced power strip incentive from BPA.
C&I	Food Processing - Radio Frequency Defrosting	Promising technology, although costs are not freely available. Have to exclude since this is an electrification technology that mostly replaces gas process heating of air and water for frozen food defrosting.
C&I	HVAC - Natural Ventilation / Mixed-Mode Conditioning	Screened out - difficult to define savings and costs due to the custom nature of natural ventilation flows based on building architecture and included in Advanced New Construction Designs measure.
C&I	Insulation - Phase Change Building Materials	Screened out as low emerging technology with low likelihood of gaining market traction. Not commercially available at the moment.
C&I	Insulation - Wall Cavity - Aerogel	Screened out - no savings data available, and difficult to get trustworthy costs; recommend revisiting this high efficiency insulation level later. While some target costs may be available, this advanced insulation material is not prevalent at this time and it is especially difficult to justify the cost for the large surface area of a commercial building envelope.

Sector	Measure Name	Rationale for Exclusion
C&I	Insulation - Wall Cavity - Vacuum Insulated Panels	Screened out - no savings data available, and difficult to get trustworthy costs; recommend revisiting this high efficiency insulation level later. While some target costs may be available, this advanced insulation material is not prevalent at this time and it is especially difficult to justify the cost for the large surface area of a commercial building envelope.
C&I	Municipal Water Treatment - High-Speed Turbo Blowers	No cost data is readily available, but this technology is commercially available.
C&I	Municipal Water Treatment - Fine Bubble Diffuser Aeration	Could include, though savings data unreliable. Will consider if enough data is available.
C&I	Municipal Water Treatment - UV-C LED Disinfection	This technology is still being studied for disinfection effectiveness (including an ongoing investigation by AEG), and UV LED solutions for larger drinking water applications are not commercially available at this time. AEG does have some rough estimates but does not expect this technology to be more available for another 5 years.
C&I	Non-Intrusive Load Monitoring	Screened out - this is an enabling technology that allows for more accurate disaggregation and enables more effective behavioral programs for customer feedback, in-home displays and reports, and further EE measure assessment/recommendation. Could be included as part of behavioral program suite.
C&I	Paper and Pulp - Low Shear Repulping Unit for Coated Paper Recovery	Significant amount of energy and (unquantified) non-energy benefits compared to a thermo-mechanical pulp mill processing virgin material. Can include if more data is found, but not enough to include at the moment.
C&I	Process - Additive Manufacturing - Aerospace - Titanium Brackets	<p>The Pacific Northwest (specifically Washington) has a large aerospace industry. AEG has found significant potential for additive manufacturing in this field. While process measures are always custom and difficult to quantify, AEG can leverage our prior case study and lifecycle analysis for this application to characterize this measure.</p> <p>Note: While AM does provide significant energy savings on a Btu basis, these are typically not electricity savings. Electrification/fuel switching occurs by supplanting large gas heating process with electrified AM/industrial 3D printing methods.</p>
C&I	Process - Additive Manufacturing - Automotive - Aluminum Pump Housing	<p>AEG has found significant potential for additive manufacturing in the automotive field. While process measures are always custom and difficult to quantify, AEG can leverage our prior case study and lifecycle analysis for this application to characterize this measure.</p> <p>Note: While AM does provide energy savings on a Btu basis, these are typically not electricity savings. Electrification/fuel switching occurs by supplanting large gas heating process with electrified AM/industrial 3D printing methods.</p>

Sector	Measure Name	Rationale for Exclusion
C&I	Process - Heat Treatment - Electron Beam Curing	This measure can apply across many manufacturing segments, but no costs are currently available. Possibility of fuel switching when autoclaves are direct fuel-fired, but the autoclaves discussed by E3TNW are electric. Very limited applicability.
C&I	Process - Heat Treatment - Microwave Curing/Sintering/Heat Treatment	This measure can apply across many manufacturing segments, but no costs are currently available. Possibility of fuel switching when ceramic sintering units are direct fuel-fired, but the baseline units discussed by E3TNW are electric.
C&I	Process Heating - Exhaust Energy Recovery	Screened out - custom applications that are often retrofitted on a natural gas system. No costs available.
C&I	Process Optimization - Near-Net-Shape Casting	Screened out - Promising measure, but applicable to direct fuel-fired process and unlikely to save electricity on site.
C&I	Radiant HVAC - Chilled Beam/Ceiling Panels	Promising technology to investigate further; unlikely to get robust prescriptive measure characterization.
C&I	Refrigeration - CO2 Compression	While this technology may be expensive due to high pressure requirements and has not been widely implemented in the United States to date, it has seen a significant amount of installations in Europe. This is a promising application and is an appealing way to supplant high GWP refrigerants. Transcritical CO2 refrigeration systems in a C&I setting require more custom design and should be revisited in future years.
C&I	Refrigeration - Heat Recovery	Screened out - no savings data readily available, and difficult to get trustworthy costs for a custom measure such as this. The heat recovery system must be engineered for each industrial application due to the varying parameters of the refrigeration system and heat sinks available at a particular facility.
C&I	Refrigeration - Install High Efficiency Subcooled Multiplex	Can include; the effort required to characterize this measure would be significant if PG&E workpaper (PGE3PREF117) does not have sufficient data.
C&I	Refrigeration - Non-Vapor Compression - Magnetocaloric	Screened out - will be reflected in high efficiency refrigeration if it comes on market, but technology is only at prototypical level.
C&I	Refrigeration - Thermal Storage - Phase Change Materials	While this is primarily a load shifting technology, letting the refrigeration system coast over the peak period also saves energy by operating during off-peak, colder periods. Most demonstration projects have been done in Southern California with one in the Bay Area. AEG recommends further Pacific Northwest pilots and revisiting this measure once it is more prevalent. Energy savings can be included as part of Class 1&3 measure.

Sector	Measure Name	Rationale for Exclusion
C&I	Windows - High Efficiency Glazing - Dynamic	Thermochromic technology not as versatile as electrochromic but potentially cheaper. Unlikely to be cost effective without non-energy benefits from comfort/productivity.
C&I	Commercial Laundry - Clothes Dryer - Automatic Cycle Termination	This feature is assumed to be included in high efficiency options and is unlikely to be implemented as a stand-alone retrofit option on packaged clothes drying systems. Clothes dryers meeting the ENERGY STAR specification (20% below standard) typically employ improved automatic termination sensors to avoid wasted energy from over-drying clothes.
C&I	Commercial Laundry - Clothes Dryer - Heat Pump	Small units in a commercial setting are already included in the residential multifamily segment. Not yet applicable to larger units; revisit in future study.
C&I	Scientific Irrigation Practices	Screened out per recent RTF / NWPCC Agriculture potential study guidance that this has become standard practice.
C&I	HVAC - Heat Recovery with Variable Refrigerant Flow	This measure specifically focuses on combining VRF and Heat Recovery systems. A VRF heat pump is already included as part of the equipment list and would result in too much overlap.
C&I	Motors - Two-Stage Gearboxes	Lack of reliable measure data resulted in this measure's exclusion.

## CLASS 2 DSM RESOURCE RAMPING

This appendix presents the methods used by Applied Energy Group (AEG) to develop reasonable estimates of annual Class 2 DSM (energy-efficiency) potential available for acquisition in PacifiCorp's California, Idaho, Utah, Washington, and Wyoming service territories for consideration in PacifiCorp's 2019 Integrated Resource Plan (IRP).

### General Methodology

AEG began by estimating the technical potential for Class 2 DSM resources in the given territory. That is, the amount of energy that could be saved in the absence of market barriers and cost-effectiveness considerations. This technical potential is then translated to annual technical achievable potential by applying achievability factors and "ramp rates," representing the rate at which these resources could be achieved in each market. The application of achievability factors and ramp rates is consistent with the method used by the Northwest Power and Conservation Council (Council) in its Seventh Northwest Conservation and Electric Power Plan (7th Plan). The resulting quantities are then presented as "annual technical achievable" potential, allowing PacifiCorp's IRP model to determine the amount of technical achievable potential that is cost-effective in a given year, which informs PacifiCorp's acquisition targets in each state.

AEG assumes that Class 2 DSM measure acquisition is ramped (i.e., acquired) over the planning horizon depending on market availability. In general, market availability is dictated by the existence of programs, customer awareness, technology availability, and other considerations. The intent of this ramp rate is to establish a path to full market maturity for each measure or technology group and ensure that resource planning selections don't overstep acquisition capabilities. Class 2 DSM resources are divided into two categories, each of which has its own timing and achievability considerations:

- *Lost Opportunity Resources* are opportunities at the time of equipment burnout or new construction. When equipment is replaced, a unique opportunity exists to upgrade efficiency at incremental (above standard equipment), rather than full cost. If standard equipment is installed, the high-efficiency equipment would not be installed until the new equipment reaches the end of its normal life cycle, without early replacement (usually requiring a significantly higher incremental cost). The same applies for opportunities at the time of new construction.
- *Discretionary Resources* are retrofit opportunities in existing building stock that are not subject to such stringent timing constraints and can, theoretically, be acquired at any point in the planning period assuming customer willingness and necessary delivery infrastructure.

The timing challenges created by lost opportunities make these resources more difficult to acquire than discretionary opportunities. As detailed in the methodology section below, we assume that 85% of discretionary potential can be acquired over the planning period but estimate a lower achievable rate for lost opportunity resources depending on the measure life, equipment stock turnover, and other factors. These assumptions are consistent with those used in the Council's 7<sup>th</sup> Plan.

In addition to the timing considerations for each measure, it is important to recognize the interaction between the two measure types. For example, if a functioning, but inefficient, refrigerator is replaced before the end of its useful life (a discretionary opportunity), then those savings should not also be counted as an equipment replacement opportunity when the original unit would have needed to be replaced (lost opportunity). Similarly, if a home is weatherized (discretionary), upgrading the heating or cooling equipment will save less than it would have in absence of weatherization.

Both methods use recent state-specific program history to inform short-term achievable potential to account for the level of program infrastructure and awareness currently in place in each jurisdiction. This process is designed to avoid large increases or decreases in short-term acquisition, which are unlikely to occur in practice.

## Specific Ramp Rate Methodology

This subsection describes AEG's process for applying ramp rates. The analysis distinguishes between measure ramping, which reflects the technical limitations of acquiring individual measures, and market ramping, which accounts for the level of delivery infrastructure in specific markets in PacifiCorp's jurisdictions. Measure and market ramp rates are provided in Table E-1 at the end of this section. Annual values for lost opportunity measure ramp rates indicate the share of the annual opportunity deemed achievable, whereas discretionary values indicate the cumulative share of the 20-year opportunity assumed to be achievable by a given year.

### Measure Ramp Rates

The study applied measure ramp rates to determine the annual availability of the identified potential lost opportunity and discretionary resources, interpreting and applying these rates differently for each class (as described below). Measure ramp rates generally matched those used in the Council's 7th Power Plan, although the study incorporated additional considerations for Class 2 DSM measure acquisition:

- For lost opportunity measures, the fourth year of the 7th Power Plan ramp rates (2019) was aligned with the study's first year (2019). Discretionary measures were aligned with the first year of the 7<sup>th</sup> Power Plan ramp rates (2016).
- For measures not included in the 7th Power Plan, the study assigned a ramp rate considered appropriate for that technology (i.e., the same ramp rate as a similar measure in 7th Power Plan).

### Lost Opportunity Resources

Lost opportunity energy efficiency measures correspond to equipment measures, which follow a natural equipment turnover cycle, as well as non-equipment measures in new construction instances that are fundamentally different and typically easier to implement during the construction process as opposed to after construction has been completed.

In addition to natural timing constraints imposed by equipment turnover and new construction rates, the AEG team applied measure ramp rates to reflect other resource acquisition limitations over the study horizon, such as market availability. These measure ramp rates have a maximum value of 85%, reflecting the Council's assumption that, on average, up to 85% of technical potential could be achieved in a given year by the end of a 20-year planning horizon. Per Council methodology, emerging technology measures on the "LOMax60" rate will instead reach a maximum value of 55%. When combined with the effects of stock turnover for lost opportunity measures, this equates to 20-year potential savings that are lower than 85% of the technical opportunity. Overall, this results in achievability of 74% of the lost opportunity technical potential over the 20-year study period.

To calculate annual technical achievable potential for each lost opportunity measure, the study multiplied the number of units turning over or available in any given year by the adoption factor provided by the ramp rate, consistent with the Council's methodology. Because of the interactions between the equipment turnover and new construction, the lost opportunities of measure availability until the next life cycle, and the timeframe limit at 20 years, the Council methodology for these measures produces potential less than 85% of technical potential.

### Discretionary Resources

Discretionary resources differ from lost opportunity resources due to their acquisition availability at any point within the study horizon. From a theoretical perspective, all technical achievable potential for discretionary resources could be acquired in the study's first year. However, from a practical perspective,

this outcome is realistically impossible to achieve due to infrastructure and budgetary constraints as well as customer preferences and considerations.

As a result, the study addresses technical potential for discretionary resources by spacing the acquisition according to the ramp rates specified for a given measure, thus creating annual, incremental values. To assess technical achievable potential, AEG then applies the 85% market achievability limit defined by the Council. Per Council methodology, emerging technology measures on the "RetroMax60" rate will instead reach a maximum value of 55%.

### **Market Ramp Rates**

The 2017 assessment applied market ramp rates on top of measure ramp rates to reflect state-specific considerations affecting acquisition rates, such as age of programs, small and rural markets, and current delivery infrastructure. This mechanism was used solely in the Wyoming industrial sector to reflect that program momentum is still building. The current assessment has removed this market ramp rate, as noted in Volume 2 of this report.

Table E-343 Measure and Market Ramp Rates Used in AEG's Analysis

Ramp Rate Name	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	2037	2038

<sup>D</sup> Indicates discretionary measure ramp rate

\* Assumption of 55% maximum achievability from Council's 7<sup>th</sup> Power Plan

\*\* Modeled as 65% of available opportunity in new construction every year to reflect Council's assumption that less than 85% of lost opportunities are achievable over 20 years.

\*\*\*Behavioral program savings are highly dependent on implementation practices. These custom ramp rates were developed to correspond with PacifiCorp's planned implementation schedule over the next two to three years. The Washington market is assumed fully saturated before study period.

## COMPARISON OF WASHINGTON MEASURES TO THE COUNCIL'S 7TH PLAN AND THE RTF

In compliance with Chapter 19.285 of the Revised Code of Washington (RCW), Chapter 480-109 of the Washington Administrative Code (WAC), and as described in Volume 2 of this report, this study employs methodologies consistent with the Northwest Power and Conservation Council's (Council's) Northwest Conservation and Electric Power Plan to estimate available Class 2 DSM (energy-efficiency) potential in PacifiCorp's Washington territory. Additionally, AEG conducted a thorough review of baseline and measure assumptions used by the Council or by the Regional Technical Forum (RTF); these included costs, savings, applicability, and base year saturation. Although this study relies on data specific to PacifiCorp's service territory wherever possible, Council/RTF assumptions were incorporated where appropriate.

Since the completion of the Council's 7th Plan, the RTF has continued to review baseline and measure assumptions. Accordingly, AEG prioritized more recent RTF assumptions, reflecting updated analyses and methodologies employed in the region. A comparison to Council/RTF unit energy savings (UES) values is shown in the following tables.

As part of this multi-state study, measures were mapped, where possible, to RTF and 7th Plan measures. However, not all measure names, measure-efficiency tiers, measure iterations, and measure savings will directly mirror the RTF or 7th Plan. These differences account for changes in federal equipment efficiency standards, the latest version of Washington energy code(s), and characteristics specific to PacifiCorp's territory, where appropriate. For certain measures, due to the overall complexity of updating the RTF and Council measure savings to current code and standards directly, the measure savings were calculated as a percent of end-use consumption and assumed to apply as such throughout the analysis time horizon.

### Residential Sector

Differences between AEG and Council/RTF UES values in the residential sector are primarily driven by inputs to building simulation modeling, measures referencing PacifiCorp evaluation results, and updates reflecting recent ENERGY STAR specifications and/or changes in energy code and equipment efficiency standards. To develop estimates of energy consumption and savings for weather-sensitive equipment and measures (e.g., central air conditioning, heat pumps, and insulation) in single-family, multifamily, and manufactured homes, the Council and RTF use the Simple Energy and Enthalpy Model (SEEM), whereas AEG used its in-house Building Energy Simulation Tool (BEST), which is based on the DOE-2 building simulation tool. Model inputs were adjusted for PacifiCorp's territory, customizing parameters such as building square feet and climate zones to match customer-specific data. Thus, the methodology to estimate savings is comparable to that employed by the Council and RTF, but the actual savings may differ due to unique characteristics of homes within PacifiCorp's service territory compared to Northwest regional averages. A comparison of residential UES values and explanations of differences, where material, are provided in Table F-1 below.

### Commercial Sector

For the commercial sector, RTF and Council measure savings were represented in the model as a percentage of end-use consumption. RTF and Council measure workbooks may contain multiple savings values based on the capacity, efficiency, fuel type, climate zone, etc. Therefore, weighted averages were used to develop a single savings value that is specific to PacifiCorp's service territory, where possible.

In addition, there are some measures that exist in the residential sector but not in the commercial sector. For example, residential-sized clothes washers and dishwashers are applied in commercial buildings, but no RTF workbook exists. In these cases, AEG used the residential sector workbook,

The major differences between commercial RTF/Council savings values and those developed for Washington in this assessment are driven by the use of PacifiCorp evaluation results, Washington building codes and/or efficiency standards, and updates reflecting recent changes in ENERGY STAR specifications. See Table F-2 for a measure-level comparison of savings values and explanations of key drivers of differences, where present.

### **Industrial, Irrigation, and Street Lighting Sectors**

For the industrial sector, the end use savings assumptions again relied heavily on the RTF and the Council's industrial analysis in the 7th Plan. Updates were made based on recent energy savings assumptions from the U.S. Department of Energy's (DOE) Industrial Assessment Center (IAC) Database, Northwest Energy Efficiency Alliance's (NEEA's) 2014 Industrial Facilities Site Assessment (IFSA), PacifiCorp's Market Characterization studies, and other industrial sources. Primary differences in industrial savings between this study and the region are driven by PacifiCorp's specific mix of industry and facility types and the use of a recently updated United Nations Industrial Development Organization study on industrial measure improvements. See Table F-3 for a measure-level comparison of savings values and explanations of key drivers of differences, where present.

The irrigation sector savings assumptions are largely based off agriculture measure workbooks in the 7<sup>th</sup> Plan, adapted to use throughout PacifiCorp's service territory. See Table F-4 for a measure-level comparison of savings values and explanations of key drivers of differences, where present.

The street lighting sector relied on PacifiCorp's current inventory of existing equipment and replacement options. Measure and baseline efficiencies are territory-specific based on PacifiCorp's data and differ from Council assumptions in some cases. See Table F-5 for a measure-level comparison of savings values and explanations of key drivers of differences, where present.

Table F-344 Comparison of 7<sup>th</sup> Plan and RTF Residential Measures in Washington

Segment	Measure Name	End Use	Unit Definition	Average Savings per Unit (Annual kWh @meter)	7th Plan/RTF Savings per Unit (Annual kWh @meter)	Reference 7PP/RTF Workbook	Notes
Single Family	Air-Source Heat Pump	Cooling	Installation	0.00	0.00	RTF ResSFExistingHVAC-4.2

# STATE-LEVEL ADMINISTRATIVE COST ANALYSIS AND FINDINGS

As part of PacifiCorp's 2019 Potential Assessment, AEG was tasked with assessing the utility cost required to administer Class 2 DSM programs within PacifiCorp's Washington, California, Idaho, Utah, and Wyoming service territories. There was particular interest surrounding the following question: "Are there differences between admin costs in larger, more urban, territories compared to smaller, rural ones?" To address this question, AEG analyzed data from PacifiCorp's DSM Annual Reports for 2014 through 2016 and compared it with information reported by similar utilities within the western United States. This memo describes the high-level outcome, approach and results from this analysis.

## Summary of Results

We have three key findings:

- The analysis of PacifiCorp program costs reveals that admin costs are substantially lower in Utah compared with the other states.
- Benchmarking savings and costs is a difficult task. Not only is it challenging to identify a peer group, the available data are also incomplete. Nevertheless, we were able to ascertain that the average cost for gross first-year savings is higher for utilities in rural areas than it is for utilities in larger, more urban areas.
- AEG recommends PacifiCorp consider varying administrative cost values as percent of incremental customer costs by state. AEG recommends using a value of 18% of Utah, 35% of Washington, 44% for California, 36% for Idaho, and 27% for Wyoming.

We present the analysis approach and results in more detail below.

## Approach

To assess these impacts, AEG defined two metrics to analyze:

- Administrative cost as % of incremental customer cost represents the utility costs required to administer Class 2 DSM programs divided by total incremental customer costs. The standard planning assumption in the region, as well as throughout the country, is a value of 20%. That means that for every \$100 a customer spends; the utility must pay an additional \$20, not including customer incentives. This is the metric and value that we have used in past potential studies and refining this estimate is the primary focus of this analysis.
- Total utility spending per gross first-year kWh saved incorporates all utility spending on Class 2 DSM programs (including incentives) divided by all gross energy saved as a result of this spending. As an example, a value of \$0.20/kWh would imply that the utility must spend \$20 to realize 100 kWh of savings. This metric was chosen due to the data available in E Source's "DSM Dat" database<sup>1</sup>, which includes program-level data on first-year energy savings as well as total utility spending for many utilities within the Western United States. We used this data for benchmarking purposes.

AEG utilized data from PacifiCorp's Annual Reports<sup>2</sup> for the five states of interest to quantify utility spending on Class 2 DSM programs over the years of 2014 through 2016, the most recent years with evaluated data available. Among other things, the annual reports include data on utility administrative spending, incentives, and gross customer costs at the state, program, and even measure category level. AEG constructed a database containing this data from all reports and then we rolled the data up at the state-level to quantify the impacts. We began by identifying the non-incentive administrative costs to include in the analysis. Within the non-incentive administrative costs, AEG included:

- Portfolio Costs
- Engineering Costs
- Utility Admin Costs
- Program Development Costs
- Program Delivery Costs

We excluded costs for NEEA payments as well as costs for low-income programs and school education. We removed NEEA costs because they have been considered separately of other DSM programs in the past. Low-income program costs were excluded since those programs are administered for reasons that go beyond achieving energy savings, which makes them costlier to run. Finally, energy savings are not always associated with educational programs, so we excluded these as well.

The second step was to exclude specific programs from the analysis.

- Home Energy Reports (HER) were excluded since the program is administered separate from other programs and the cost to the customer is \$0, which is not representative of non-behavioral programs. Additionally, a large majority of HER potential is captured within the potential study baseline since these programs have already matured and expanded within the territory.
- "See Ya Later Refrigerator", PacifiCorp's appliance recycling program, was cancelled in 2016 due to high measure costs and is no longer offered to customers. Since potential from recycling measures will not be captured within the potential study, we excluded these programs as well.

All other PacifiCorp programs namely Home Energy Savings (HES) and Wattsmart Business, were included in the analysis.

<sup>1</sup> A description of E Source's "DSM Dat" database may be found online at: <https://www.esource.com/about-dsmdat>

<sup>2</sup> Please see "Reports and Program Evaluations by Jurisdiction" for the publicly available data used to conduct this analysis at: <http://www.pacificorp.com/es/dsm.html>.

California reports have not been published but were provided to AEG for this analysis.

## Analysis of PacifiCorp Data

Results of this analysis for each state and year are presented below. Cells shaded grey were analyzed, but ultimately excluded from this analysis as non-representative of typical years:

*Table G-1 Utility Administrative Costs as Percent of Incremental Measure Cost for PacifiCorp's Service Territory, 2014-2016*

Admin % Customer	Utah	Washington	California	Idaho	Wyoming
2014	17%	34%	46%	60%	49%
2015	19%	34%	30%	36%	41%
2016	19%	37%	42%	36%	27%
<b>All Years</b>	<b>18%</b>	<b>35%</b>	<b>44%</b>	<b>36%</b>	<b>27%</b>

From this analysis, a few conclusions may be drawn:

- It is cheaper for PacifiCorp to administer Class 2 DSM programs in Utah. PacifiCorp's Utah market is substantially larger than PacifiCorp's markets in the other states. In addition, the Utah market has more high-use customers, which are less expensive to serve because a relatively few transactions yields substantial savings. In addition, the service territory is more urban, and the higher density makes it easier for PacifiCorp and its trade allies to serve. The fact that Utah is more urban, while the other service territories are more rural, leads us to a recommendation to quantify administrative costs for Utah separately from PacifiCorp's four more rural territories.
- 2014 was not a representative year in Idaho due to very high commercial costs. In 2014, administrative costs in Idaho were an outlier. This is apparent within the commercial "Wattsmart Business" program, where administrative costs were greater than 50% of incremental customer costs. It appears that this is due to lower than expected participation, but fixed administrative costs remained in a similar spot. As a result, we excluded this atypical Idaho data in 2014 from the final analysis.
- Costs in Wyoming decreased significantly between 2014 and 2016. Class 2 DSM programs within PacifiCorp's Wyoming territory have been ramping up between 2014 and 2016 as the program matures. Between these three years, savings for the Home Energy Savings and Wattsmart Business programs have increased by about 10,000 MWh per year. Because a significant portion of administrative costs are fixed, we expect cost per kWh saved to decrease. Accordingly, AEG concluded Wyoming data from 2014 and 2015 is not representative of current programs and excluded these years from the analysis.

## Benchmarking Analysis

In addition to analyzing and comparing cost data within the PacifiCorp service areas, we also wanted to see if there were similar differences within a peer group of utilities. We compared utility spending with similar utilities in the western United States, using publicly available information from E Source. This dataset includes utilities from Washington, California, Idaho, and Utah as well as Oregon, Colorado, Nevada, Arizona, and New Mexico. To utilize this data, we first excluded programs considered to be dissimilar to PacifiCorp's Class 2 portfolio (e.g. demand response programs) as well as programs excluded from the main analysis above (e.g. low income and appliance recycling). AEG then assigned each utility to one of three categories:

- Rural utilities tend to cover smaller portions of a state and do not serve a major urban center. On average, total sales for these utilities is lower than those in the next category. Examples include Black Hills Energy in Colorado, Idaho Power in Oregon, and the Imperial Irrigation District in California.
- Large/Urban utilities tend to be larger in size and serve a major urban center, such as Salt Lake City or Los Angeles. Due to high population densities in urban areas, annual sales for these utilities are generally larger than their rural counterparts. Examples include Puget Sound Energy in Washington, NV Energy in Nevada, Los Angeles Department of Water and Power and San Diego Gas and Electric in California, Arizona Public Service in Arizona, and PNM in New Mexico.

Some utilities only reported net savings, rather than gross. In these cases, AEG converted these to gross savings using an average net-to-gross (NTG) ratio of roughly 0.85. This data was derived from a survey conducted by Synapse Energy Economics of 292 net-to-gross (NTG) ratios spanning all fifty states between 2011 and 2015<sup>3</sup>.

The analysis revealed that the cost per gross kWh saved is about \$0.18/kWh for larger utilities in more urban settings. Costs are higher, an at average of \$0.23/kWh, for utilities with smaller, more rural service territories.

## Final Results and Comparisons

The table below summarizes the final results of this analysis and the key findings are:

- The analysis of PacifiCorp program costs reveals that admin costs are substantially lower in Utah, a larger urban service territory, compared with the other states in the PacifiCorp system.
- Benchmarking results show a similar pattern: costs are lower in larger, more urban service territories.

Table G-2 Summary of Utility Administrative Costs and Comparison with Similar Utilities

PacifiCorp Territory	PacifiCorp Admin Cost as a % of Customer Cost	Benchmark Territory Type	Benchmark Results for Program Spending (\$/Gross kWh Saved)
WA, CA, ID, and WY Average	34%	Smaller / Rural	\$0.23
Utah	18%	Large / Urban	\$0.18
<b>Total PacifiCorp</b>	<b>21%</b>	<b>Combined</b>	<b>\$0.20</b>

# WASTE-HEAT-TO-POWER AND REGENERATIVE TECHNOLOGY ANALYSIS AND FINDINGS

## Overview

In 2014, CLEAResult evaluated the potential for Waste Heat to Power (WHP) and Regenerative Technologies (RT) in PacifiCorp service territory. In 2018, AEG was tasked by PacifiCorp to update the findings from the 2014 WHP and RT potential evaluation study, using recent customer data and technology data. This appendix presents the methodology of AEG's analysis and subsequent results.

AEG staff reviewed the CLEAResult approach and made updates to assumptions used in the 2014 WHP and RT potential study. We describe these modifications and data updates below. We begin with the WHP technologies, followed by the elevator regenerative technology and concluding with the conveyor regenerative technology.

### Waste Heat to Power Technology Updates:

- We replaced 2014 customer billing data with 2016 customer billing data.
- Because ten WY and UT customers had erroneous 2016 billing data (e.g., annual electric load factor >100%), we used 2014 customer billing data for these 10 customers.
- Like the 2014 WHP and RT potential study, we only considered commercial and industrial sites with an annual peak demand of at least 1 MW.
- We reviewed current and emerging WHP and RT technologies. In collaboration with PacifiCorp staff, we selected the following technologies for the 2016 WHP and RT potential update: Organic Rankine Cycle (ORC), Steam Rankine Cycle (SRC), Steam System Optimization, Elevator Regeneration, and Conveyor Regeneration.
- With the exception for Micro Hydro technology, which was removed to prevent double-counting of energy savings since it is studied separately by PacifiCorp, the five technologies listed above are the same as those included in the 2014 WHP and RT potential study.
- We updated the installed capital cost, O&M cost, and lifetime for the selected WHP technologies using recent data from ORNL<sup>4</sup>, DOE<sup>5</sup>, and EPA<sup>6</sup>. Table 1 summarizes the updated input values for the selected WHP technologies. All costs are reported in \$2016 values. Revised estimates as well as information sources are documented in the new "Tech Inputs" tab in the WHP Market Estimator tool.
- Like the 2014 WHP and RT potential study, we assumed a maximum capacity limit of 1 MW for WHP systems to remove overlap with Qualifying Facilities.
- We reduced annual operating hours for WHP systems from 8,000 to 7,500 hours based on a reported value by EPA.<sup>7</sup>
- We reduced the waste heat to power efficiency for ORC systems from 15% to 10%. While an efficiency of 15-20% can be achieved in high-temperature ORC applications, an efficiency of 10% is more commonly found in low- to medium-temperature waste heat applications.<sup>8</sup> As such, we believe an efficiency of 10% is a better estimate for medium-temperature ORC applications considered in this potential assessment since SRC technology is typically employed for high-temperature waste heat applications.

<sup>6</sup> US EPA, Waste Heat to Power Systems, May 30, 2012.

<sup>7</sup> Ibid.

<sup>8</sup> ICF International, Waste Heat to Power Market Assessment, March 2015. Prepared for Oak Ridge National Laboratory.

- We updated 2010 MEC Survey Data with 2014 MECS Survey Data.<sup>9 10</sup>
- We included 2012 CBCES data to help identify commercial buildings with opportunities for WHP.<sup>11</sup> Example commercial candidates for WHP include larger campuses and hospitals that currently generate steam for onsite use.
- We reviewed the DOE CHP Database to identify commercial and industrial customers with existing WHP systems in CA, ID, UT, WA, and WY.<sup>12</sup>

Table H-1 Technology Costs and Measure Life for Selected WHP Technologies

Sector	Technology	System Size (kW)	Lifetime	2016\$/kW Installed Capital Cost	Non-fuel 2016\$/kWh Annual O&M Cost
C&I	Organic Rankine Cycle (100 kW)	100	15	\$ 5,110	\$ 0.0217
C&I	Organic Rankine Cycle (500 kW)	500	15	\$ 4,227	\$ 0.0175
C&I	Organic Rankine Cycle (1 MW)	1,000	15	\$ 3,847	\$ 0.0159
C&I	High Temp. Waste Heat (100 kW)	100	15	\$ 3,370	\$ 0.013
C&I	High Temp. Waste Heat (500 kW)	500	15	\$ 2,725	\$ 0.0113
C&I	High Temp. Waste Heat (1 MW)	1,000	15	\$ 2,448	\$ 0.0088
C&I	Steam System Optimization (1 MW)	1,000	20	\$ 1,003	\$ 0.010

### Elevator Regeneration Technology Updates

- We updated the baseline electricity consumption (MWh) data for the offices segment in CA, ID, UT, WA, and WY based on more recent (2016) PacifiCorp customer data. This approach allowed for the removal of extraneous assumptions (incl. total demand (aMW), percentage of total demand for offices, and annual operating hours) from the analysis for these states.
- The assumption of elevator energy use being 5% of total building electricity use for offices was confirmed with a more recent source with an updated citation.<sup>13</sup>
- We updated the range of potential percent savings with corresponding source citations.<sup>14 15 16,</sup>
  1. Rather than reporting the overall measure savings as the highest possible savings percentage, we report savings using the average of the "low" and "high" estimates populated in the tool.
  2. We updated the "high" savings potential percentage from 40% to 45% of baseline elevator electricity use.

<sup>14</sup> Data from E Source via "Elevators - Madison Gas and Electric" webpage (Table 1). URL: [https://www.mge.com/saving-energy/business/bea/article\\_detail.htm?nid=1789](https://www.mge.com/saving-energy/business/bea/article_detail.htm?nid=1789)

<sup>15</sup> S. Hackel, et al. Proven Energy-Saving Technologies for Commercial Properties. NREL Technical Report, 2014.

<sup>16</sup> NREL, Proven Energy-Saving Technologies for Commercial Properties, March 2012. <https://www.nrel.gov/docs/fy15osti/63807.pdf>

- We updated the percentage of applicable offices from 50% (previously intended to represent only high-rise offices) to 25% to reflect the percentage of all elevators that can be retrofit with regenerative drives (i.e., the percentage of non-hydraulic elevators).<sup>17</sup>
- Measure lifetime was estimated at 25 years, based on 20-30-year range reported in literature.<sup>18</sup>
- Measure costs estimated based on a quote by Otis Elevator for a confidential AEG client<sup>19</sup> and data for a mid-rise commercial building as reported by E Source<sup>20</sup>. Table 2 summarizes measure life and costs for the selected Regenerative Technologies. Costs are reported in \$2016 values.

Table H-2 Technology Costs and Measure Life for Selected Regenerative Technologies

Sector	Technology	Lifetime	2016\$/Unit Installed Capital Cost	Non-fuel 2016\$/Unit Annual O&M Cost
Office	Elevator Regeneration	25	\$ 21,000	\$ n/a*
Mining	Conveyor Regeneration	20	\$ 72,100	\$ n/a*

\*We were unable to find non-fuel annual O&M costs for the regenerative technologies. For the cost-effectiveness analyses, we assumed non-fuel O&M costs for an elevator/conveyor with regenerative braking equals that of an elevator/conveyor without regenerative braking.

### Conveyor Regeneration Technology Updates

- No updates to CLEAResult's site-by-site assumptions and estimates have been made, due to the lack of reliable and more recent secondary data with which to assess typical savings. However, sites previously identified as having conveyor regeneration potential were confirmed to still be in the latest PacifiCorp customer usage dataset. The resulting savings potential for this potential is entirely due to updated baseline usage data for the applicable customers.
- Table 2 summarizes measure life and costs for the selected Regeneration Technologies. Costs are reported in \$2016 values.

## Results of Analysis

Table 3 and Table 4 below summarizes the 20-year technical achievable potential for Waste Heat to Power and Regenerative Technology measure categories respectively. Please note that this potential is included within the Class 2 potential in Volume 2, Section 4 of this report and is not incremental to it.

Table H-3 Cumulative WHP Potential by State and Measure in 2038 (MWh @generator)

WHP Measure	California	Idaho	Utah	Washington	Wyoming
Organic Rankine Cycle	0	0	84,814	4,332	13,104
High Temperature Waste Heat	0	2,415	45,266	0	10,260
Steam System Optimization	0	0	0	3,820	0
<b>Total</b>	<b>0</b>	<b>2,415</b>	<b>130,080</b>	<b>8,152</b>	<b>23,364</b>

Table H-4 Cumulative RT Potential by State and Measure in 2038 (MWh @generator)

RT Measure	California	Idaho	Utah	Washington	Wyoming
Elevator Regeneration	269	569	18,301	1,651	1,760
Conveyor Regeneration	0	0	2,318	4,975	2,391
<b>Total</b>	<b>269</b>	<b>569</b>	<b>20,618</b>	<b>6,626</b>	<b>4,151</b>
